Quick Tutorial – Building DataLex decision support systems

Graham Greenleaf, Philip Chung & Andrew Mowbray, 31 May 2019

1 Creating a new rule-base

1.1 Creating a new rule-base using the free-standing Development Tools

- No login is necessary. This page enables creation and test-runs of small applications using the DataLex software. However, it does not allow test apps to be saved.
- There are two ways to start writing an app:
  (i) Simply start writing in the ‘Edit DataLex knowledge-base’ editing screen, following the instructions in parts (2)-(7) of this Tutorial.
  (ii) If you know what section of an Australian Act you would like to start with, go to the ‘Import legislative section (available on AustLII)’ and enter the Act name, jurisdiction and section, then start editing as in (i) above.
- Select the ‘Run Consultation’ button when you are ready to test your KB. Please note:
  o After running your app (successfully or unsuccessfully) you can use your browser to come back to the KB Tools page to make further edits to your KB.
  o If your app does not run as intended, use the ‘Check Fact Cross References’ and ‘Check Fact Translations’ buttons to run diagnostics (see 5 below) to identify problems. Edit and run again.
  o If you have spent any significant time developing a test KB, you might want to save a copy in a word processor or other file, in case the browser malfunctions, or if you want to use the KB again after you have quit the browser.
- Refinements:
  o To add another section of an Act from AustLII to an existing KB, use the ‘Import and Append’ button after specifying the additional section.
  o To over-write and erase an existing KB with a new section from AustLII, use the ‘Import and Replace’ button.
  o To clear an existing KB and start again, use ‘Clear Knowledge-base’.

1.2 Creating a new rule-base in the DataLex Community

- Login to the DataLex Community page http://austlii.community/wiki/DataLex/
- To create a new Topic (ie a new rule-base), select ‘New’ from the top line.
  o Do so from the DataLex page, or it will be a sub-page from wherever you start
- In the pop-up, give your rule-base a title, preferably with ‘KB’ at the end;
  o select ‘DataLexKBTemplate as the Template; √ Submit.
- In the editing screen for the rule-base (with heading ‘Title of Knowledge-base’), start editing your rule-base by deleting ‘ADD RULES HERE’.
  o One way to start a rule base is to paste in a legislative section, and start editing it to create rules.
Quick Tutorial – Building DataLex decision support systems

2 The structure of rules

- Simplest syntax: RULE name of rule PROVIDES statements
- The keyword ‘RULE’ indicates the start of a new rule.
  - Use GOAL RULE (at least twice) to give users a choice of starting goals
- The name of the rule: must be unique; often name of Act and section
  - Names of rules are used to give users a choice of GOALS
- The keyword ‘PROVIDES’, indicates the start of the body of the rule
- The statement(s) (one or more) are the content of the rule, and consist of declarations; a simple and common statement is in the form ‘IF condition THEN conclusion’.
- A declaration contains keywords and descriptors; Keywords are logical connectors between descriptors; declarations assert that these connections are true.
- A keyword is an English-like expression which asserts some logical connection between two descriptors, or asserts some characteristic about one descriptor. Keywords are written in FULL CAPITALS.
- A descriptor is a term or phrase which describes some object, event etc. A descriptor is a proposition which is capable of being true or false (ie ‘truth bearing propositions’). Write them in lower case with normal capitalisation, and be consistent in multiple uses.

3 Commonly used keywords (full list is attached)

<table>
<thead>
<tr>
<th>Keywords</th>
<th>Meaning</th>
<th>Types of uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>ONLY IF</td>
<td></td>
<td>use for ‘means’ definitions</td>
</tr>
<tr>
<td>IF .... THEN</td>
<td></td>
<td>use for ‘includes’ definitions</td>
</tr>
<tr>
<td>IF ... THEN ... ELSE</td>
<td></td>
<td>use for alternative conclusions</td>
</tr>
<tr>
<td>AND</td>
<td>normal ‘and’</td>
<td></td>
</tr>
<tr>
<td>OR</td>
<td>normal ‘or’</td>
<td></td>
</tr>
<tr>
<td>AND/OR</td>
<td>OR with higher binding strength (like parentheses)</td>
<td>use where an OR follows an AND in a declaration</td>
</tr>
</tbody>
</table>

4 Named subject keywords

- Use named subject as much as possible to make consultation dialogues more realistic and customised to a particular problem.
- Subject declarations can appear anywhere in a rule-base, but usually go at the start.
- Make sure the named subject is referred to consistently (use ‘Check Fact Cross References’ to be sure).
  - PERSON – where the subject is a human person, not a legal person
    - Example: PERSON the intestate
  - THING – where the subject is not a human person
    - Example: THING the agreement
  - PERSONTHING – where the subject can be either human person or a legal person
    - Example: PERSONTHING the first party

5 Running and checking rule-bases

- To run a rule base so as to test how it is working, select ‘Run Consultation’.
- Use ‘Check Fact Cross References’ to check whether descriptors have been used consistently across rules. Similarly named but not identical descriptors are one of the main reasons why rules do not run as expected.
Quick Tutorial – Building DataLex decision support systems

• Use ‘Check Fact Translations’ to ensure that descriptors used in your rule-base are being translated into readily understood forms as questions, positive assertions and negative assertions. If this is not occurring, consider modifying the descriptor. (‘applies’ is a useful term to use in descriptors concerning legislation).
  o ‘Verbs’ declarations (Manual p.18) can be used to correct mis-behaving verbs
  o If necessary, PROMPT and TRANSLATE (Manual p.19) can provide alternatives

6 Hypertext links from rule-bases

• Links should be created automatically to references to Acts or sections, or to citations of cases or articles, if they appear in the statements contained in a RULE (not its name).
• Keywords LINK and TO are used to specify in a rule-base that a particular word or phrase is always to appear as a hypertext link to a particular URL
• LINK ...TO ... can be used to create links from a rule-base to the results of any search (not only over AustLII)
  o Example: LINK official document of a Minister TO http://www.austlii.edu.au/cgi-bin/sinosrch.cgi?query=%20official+document+of+a+Minister%20

7 Linking rule-bases on multiple pages (‘cooperative inferencing’)

• The use of the keyword INCLUDE in a rule-base, followed by the URL of another page containing a DataLex rule-base, will cause the second rule-base to be loaded with the first rule-base, and the two run together.
• Multiple rule-bases can be INCLUDEd.
• The same named subject declarations can occur in two INCLUDEd rule-bases
• INCLUDE can link to rule-bases located in DataLex Communities, or at another URL
  o Example: INCLUDE http://austlii.community/wiki/DataLex/FOI4KB
### 8 List of Main Keywords

The most detailed explanation of all keywords is in the *Wysh Developer’s Manual* [https://papers.ssrn.com/abstract=2986144] - The interface described there is not current.

#### 8.1. Rule types

<table>
<thead>
<tr>
<th>RULE</th>
<th>GOAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROCEDURE</td>
<td>BACKWARD</td>
</tr>
<tr>
<td>FORWARD</td>
<td>DAEMON</td>
</tr>
<tr>
<td>DOCUMENT</td>
<td>EXAMPLE</td>
</tr>
</tbody>
</table>

#### 8.1.1. Attribute types

| BOOLEAN | INTEGER | REAL | DOLLAR | SEX | STRING | DATE |

#### 8.1.2. Document types

(Document types only)

| PARAGRAPH | LINE | TEXT |

#### 8.1.3. Named subject types

| THING | PERSONTHING | PERSON |

#### 8.1.4. Translation operators

| TRANSLATE - AS | PROMPT | VERBS |

#### 8.1.5. Statement operators

| ASSERT | DETERMINE | IF - THEN - ELSE | IF - THEN | ONLY IF | IS | WHILE - DO | REPEAT - UNTIL | CALL | BEGIN - END |

#### 8.1.6. Expression operators

**(Pre) Unary Operators**

| NOT | MINUS | PLUS | DAY | MONTH | YEAR |

**(Post) Unary Operators**

| DAYS | WEEKS | MONTHS | YEARS |

**Binary Operators**

| DIVIDED BY | TIMES | PLUS | MINUS |

| IN | EQUALS | NOT EQUALS | IS GREATER THAN | IS LESS THAN | IS GREATEREQUAL THAN | IS LESSEQUAL THAN |

| AND/OR | AND/OR/WITH | AND | AND/WITH | OR | OR/WITH |

#### 8.1.7. Layout operators

(Document types only)

| NUMBERED | LEVEL |

#### 8.1.8. Miscellaneous keywords

| RANGE - TO | VERBS | PROVIDES | ORDER |
